

Supplies needed:

Adult dose: 5g IV over 15 minutes.

Reconstitute: Place the vial in an upright position. Add 200 mL of 0.9% Sodium Chloride injection\* to the vial using the transfer spike. Fill to the line. 0.9% Sodium Chloride injection is the recommended diluent (diluent not included in the kit).

Mix: The vial should be repeatedly inverted or rocked, not shaken, for at least 60 seconds prior to infusion.

- CYANOKIT solutions should be visually inspected for particulate matter and color prior to administration
  - — Discard solution if particulate matter is present or solution is not dark red

Infuse Vial: Use vented intravenous tubing, hang and infuse over 15 minutes. Run IV wide open.

Caution should be exercised when administering other cyanide antidotes simultaneously with CYANOKIT, as safety has not been established. If a decision is made to administer another cyanide antidote with CYANOKIT, these drugs should not be administered concurrently in the same IV line.

\*No safety and efficacy studies have been performed in pediatric patients.
