

MDFR INFUSIONS

The infusions listed below are the MOST COMMON preparations for IV medication infusions.

Drug	Add this amount	To this IV bag	With this drip set	Run this fast
Amiodarone	150mg (3mL)	50mL	10gtt/mL	60gtts/min
Dopamine	400mg (10mL) ¹	500mL	60gtt/mL	
Magnesium Sulfate	2g (4mL)	50mL	10gtt/mL	
Sodium Thiosulfate	12.5g (50mL) ²	50mL	10gttt/mL	
Hydroxocobalamin	200mL NS	IV Bottle (Glass)	Vented set (Supplied)	Wide Open ³
Lidocaine	Pre-mixed	Pre-mixed	60gtts/mL	

¹ Mixing Dopamine with 400mg in a 500mL bag results in an 800mcg/mL concentration. This allows for the standardization of 60gtts/min based on 10mcg/kg/min for the average size patient (80kg)

² Remove 40mL of NS from the 50mL bag before adding the 50mL of medication to the bag.

³ If you run wide open with the vented tubing, you will achieve a flow rate close to the rate required to administer the CyanoKit over 15 minutes.
